Additional task: Fine-Tuning YourTTS

This task is optional. Students who successfully complete it will receive **an additional 0.5 points toward the exam grade**.

If you decide to complete this task, include its results in the Task 3 report and dedicate an additional 1-2 pages to the description, results, and discussion of the fine-tuning experiment.

1. Fine-tune the pretrained YourTTS model using the prepared Lithuanian training data. Use the validation data to monitor the model performance during training.

In the report:
✓ report the number of training and validation samples;
✓ report the main training parameters (number of epochs, batch size, learning rate);
✓ present the training and validation loss curves;
✓ report the total training time.

2. Use the fine-tuned model to synthesize the **same Lithuanian sentence** used before adaptation: "*Tai yra šnekos sintezės sistemos testas.*" Save and listen to the generated speech.

3. Compare the Lithuanian speech generated **before and after model adaptation**.

In the report:
✓ compare the intelligibility of the two recordings;
✓ compare the waveform and spectrogram of the generated signals;
✓ compare the fundamental frequency plots of the generated signals;
✓ summarize the main conclusions from the experiment.
